AB - JP2004018075 NOVELTY - The multilayer laminated sheet used to form the fuel tank consists of high density polyethylene layers (16,20,22,24) and ethylene vinyl alcohol layer (18). The innermost layer (12) which is in contact with the fuel, is comprised of base material (13) dispersed with fuel impregnation barrier material oriented parallel to the surface of the laminates.

- USE - For vehicle.

- ADVANTAGE - Improves resistance to fuel impregnation without impairing strength, as the innermost layer of HDPE is dispersed with fuel impregnation barrier material oriented parallel to the surface of the laminates.

- DESCRIPTION OF DRAWING(S) - The figure shows a fragmented sectional view of the recyclable resin fuel tank. (Drawing includes non-English language text).

- innermost layer 12

- base material 13

- fuel impregnation barrier material 14

- polyethylene layers 16,20,22,24

- ethylene vinyl alcohol layer 18
